Project: Subway Wall- Graffiti Protection

The Problem

This County Council undertook a program to upgrade and refurbish its subways.

It had two main objectives:

- (1) Increased protection of the subway against graffiti attack
- (2) Enhancement of the subway's appearance

The County Council stipulated that it required a high performance graffiti resistant coating that could be applied over a previously painted acrylic mural.

Solution

Wall-Tech UV was recommended for this program of work following a set of successful adhesion trials. All the subway walls were suitably prepared, painted and then over coated with Wall-Tech UV in a clear finish.

Wall-Tech UV is a water-based polyurethane coating designed for use on both external and internal walls. It offers outstanding graffiti, weather and chemical resistance together with superior gloss and color stability.
