## Project: Gutter Protection

### The Problem

The roof of this building of a worldwide supplier of automotive and building control systems, has two 162 feet long box gutters.

The client required a long-term high performance protection system, which would waterproof and weatherproof the gutters.

### Solution

The reinforced Poly-Tech system was recommended for this application based on the fact that it is totally unaffected by ponding water or permanent immersion conditions.

The surface of the box gutters was prepared in accordance with the 3M Thortex System Recommendation ensuring the substrate was clean, dry and free from contamination. It was then primed with Uni-Tech MC Primer prior to the application of the Poly-Tech system. This comprised one coat of Poly-Tech into which Thortex Chopped Strand Matt was embedded, followed by a second coat of Poly-Tech.
