## Project: Lining of Storage Container

### The Problem

This container was used to store liquefied brown coal in a briquette factory.

The container was in need of relining to extend its working life and ensure no seepage of its contents out of the container.

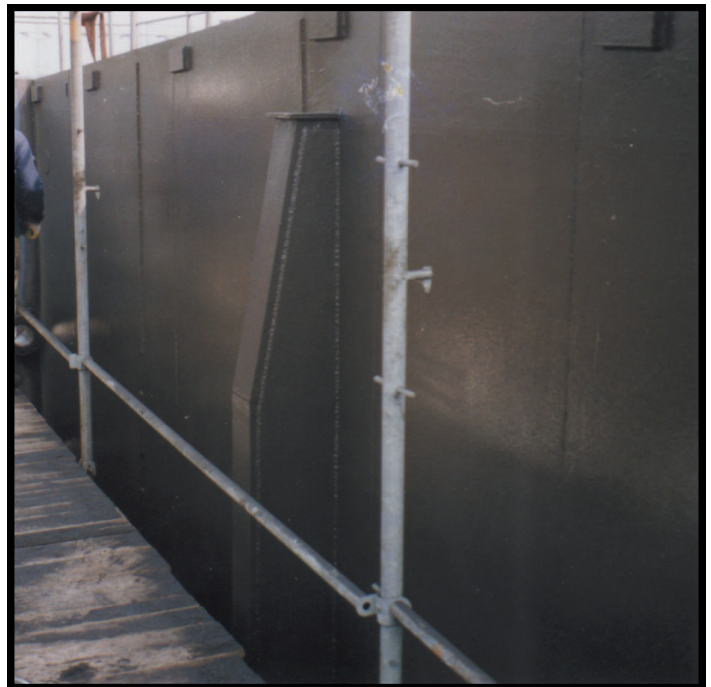

### Solution

The liquefied brown coal contained some very aggressive chemicals; it was decided that Chemi-Tech UC should be used to line the container.

Chemi-Tech UC is a two component, solvent-free coating with outstanding chemical resistance. It provides excellent protection to steel and concrete surfaces that are subjected to aggressive acids, solvents and industrial chemicals.

The entire surface was first blast cleaned and then two coats of Chemi-Tech UC were applied.

The container was protected over five years ago and has not required relining since.
